

# CONCEPT MAP

## ISOMERISM

The concept of isomerism illustrates the fundamental importance of molecular structure and shape in organic chemistry and the isomers play a vital role in biological processes.

Class XI

**Isomerism**

**Structural Isomerism**  
Same molecular formula and different bond pattern, i.e., different arrangement of atoms or groups of atoms within the molecules.

**Chain Isomerism**  
Due to different arrangements of carbon atoms leading to linear and branched chains. e.g.,  

$$\text{H}_3\text{C}-\text{CH}_2-\text{CH}_2-\text{CH}_3$$
 (Butane)  $\longleftrightarrow$   $\begin{matrix} \text{CH}_3 \\ | \\ \text{H}_3\text{C}-\text{CH}-\text{CH}_3 \end{matrix}$  (Isobutane)

**Position Isomerism**  
Due to different positions of side chains, substituents, functional groups, double bonds, triple bonds, etc. on the parent chain. e.g.,  

$$\text{H}_2\text{C}=\text{CH}-\text{CH}_2-\text{CH}_3$$
 (1st site)  $\longleftrightarrow$   $\text{H}_3\text{C}-\text{CH}=\text{CH}-\text{CH}_3$  (2nd site)

**Functional Isomerism**  
Due to presence of different functional groups. e.g.,  

$$\text{H}_2\text{C}-\text{CH}_2-\text{OH}$$
 (Ethyl alcohol)  $\longleftrightarrow$   $\text{H}_3\text{C}-\text{O}-\text{CH}_3$  (Dimethyl ether)

**Metamerism**  
Arises when different alkyl groups are attached to the same functional group. e.g.,  

$$\text{H}_2\text{C}-\text{CH}_2-\text{O}-\text{CH}_2-\text{CH}_3$$
 (Methyl ethyl ether)  $\longleftrightarrow$   $\text{H}_3\text{C}-\text{O}-\text{CH}_2-\text{CH}_2-\text{CH}_3$  (Methyl propyl ether or 1-Methoxypropane)

**Tautomerism**  
Tautomers have different functional groups and exist in dynamic equilibrium with each other due to a rapid interconversion from one form to another and the phenomenon is known as tautomerism. It is also called as *desamotropy* or *kyphotropism* or *protomerism* or *allo-tropism*. e.g.,  

$$\text{H}_3\text{C}-\text{C}(=\text{O})-\text{CH}_2-\text{CH}_3 \rightleftharpoons \text{H}_3\text{C}-\text{C}(\text{OH})=\text{CH}-\text{CH}_3$$
 (Acetone (keto form)  $\longleftrightarrow$  Prop-1-en-2-ol (enol form))  

$$\text{H}_3\text{C}-\text{N}(\text{O})-\text{O} \rightleftharpoons \text{H}_3\text{C}-\text{N}=\text{O}$$
 (Nitrosobenzene (nitroso form)  $\longleftrightarrow$  Gul base (nitro form))

**Diastereoisomers**  
• Chiral molecules having different arrangement of groups or atoms at one or more (but not all) of the equivalent stereocentres.  
• They are not mirror images and are non-superimposable.  

$$\begin{matrix} \text{CHO} \\ | \\ \text{HO}-\text{C}-\text{H} \\ | \\ \text{H}-\text{C}-\text{OH} \\ | \\ \text{CH}_2\text{OH} \end{matrix} \longleftrightarrow \begin{matrix} \text{CHO} \\ | \\ \text{HO}-\text{C}-\text{H} \\ | \\ \text{HO}-\text{C}-\text{H} \\ | \\ \text{CH}_2\text{OH} \end{matrix}$$
 (Tautomers)

**Stereoisomerism**  
Same molecular formula and bond pattern but different arrangement of atoms or groups of atoms in space.

**Geometrical Isomerism**  
Same structural formula but differ in the spatial arrangement of atoms or groups of atoms about double bond (C=C, C=N or N=N).

**Cis**  
Similar groups on the same side of the double bond.  

$$\begin{matrix} \text{X} & \text{X} \\ \diagdown & / \\ \text{C} & = & \text{C} \\ / & \diagdown \\ \text{Y} & \text{Y} \end{matrix}$$

**Trans**  
Similar groups on the different sides of the double bond.  

$$\begin{matrix} \text{X} & & \text{X} \\ & \diagdown & / \\ & \text{C} & = & \text{C} \\ & / & \diagdown & \\ \text{Y} & & \text{Y} \end{matrix}$$

**Syn**  
Two substituents (usually alkyl and hydroxyl) on the same side of the plane.  

$$\begin{matrix} \text{H}_3\text{C} & & \text{H} \\ & \diagdown & / \\ & \text{C} & = & \text{C} \\ & / & \diagdown & \\ \text{HO} & & \text{H} \end{matrix}$$

**Anti**  
Two substituents (usually alkyl and hydroxyl) on the opposite side of the plane.  

$$\begin{matrix} \text{H}_3\text{C} & & \text{H} \\ & \diagdown & / \\ & \text{C} & = & \text{C} \\ & / & \diagdown & \\ \text{HO} & & \text{OH} \end{matrix}$$

**E**  
E is assigned to an isomer in which high priority atoms or groups are on the opposite side.  

$$\begin{matrix} \text{H}_3\text{C} & & \text{H} \\ & \diagdown & / \\ & \text{C} & = & \text{C} \\ & / & \diagdown & \\ \text{H} & & \text{H} \end{matrix}$$
 (Higher group)

**Z**  
Z is assigned to an isomer in which high priority atoms or groups are on the same side.  

$$\begin{matrix} \text{H}_3\text{C} & & \text{H} \\ & \diagdown & / \\ & \text{C} & = & \text{C} \\ & / & \diagdown & \\ \text{H} & & \text{CH}_3 \end{matrix}$$
 (Higher group)

**Optical Isomerism**  
Same molecular formula but differing only in the behaviour towards polarised light are called optical isomers and the phenomenon is called optical isomerism.

**Enantiomers**  
• Chiral molecules with one or more stereocentres.  
• Non-superimposable mirror images.  
• No symmetry elements.  

$$\begin{matrix} \text{OH} \\ | \\ \text{H}-\text{C} \\ | \\ \text{CH}_3 \\ | \\ \text{CO}_2\text{H} \end{matrix} \text{ (chiral centre)} \quad \text{Mirror} \quad \begin{matrix} \text{HO} \\ | \\ \text{H}_3\text{C}-\text{C} \\ | \\ \text{HCO}_2\text{H} \\ | \\ \text{H} \end{matrix} \text{ (chiral centre)}$$

**Meso Compounds**  
• Molecules with multiple stereocentres.  
• Internal plane of symmetry thus optically inactive.  

$$\begin{matrix} \text{CO}_2\text{H} \\ | \\ \text{HO}-\text{C} \\ | \\ \text{HO}-\text{C} \\ | \\ \text{CO}_2\text{H} \end{matrix}$$
 (Plane of symmetry)

## REACTIVE INTERMEDIATES

Intermediates which are short-lived species generated during conversion of reactants to products in a chemical reaction. They play an important role in various organic synthesis as well as in biological world.

Class XI

**Structure**  

$$\begin{matrix} \text{Empty } p\text{-orbital} \\ | \\ \text{R} & \text{C} & \text{R} \\ / & & \backslash \\ \text{R} & & \text{R} \\ | & & | \\ \text{R} & & \text{R} \end{matrix}$$

$$\begin{matrix} \text{R} & & \text{R} \\ / & & \backslash \\ \text{C} & & \text{C} \\ | & & | \\ \text{R} & & \text{R} \end{matrix}$$

$$\begin{matrix} \text{R} & & \text{R} \\ / & & \backslash \\ \text{C} & & \text{C} \\ | & & | \\ \text{R} & & \text{R} \end{matrix}$$

$$\begin{matrix} \text{R} & & \text{R} \\ / & & \backslash \\ \text{C} & & \text{C} \\ | & & | \\ \text{R} & & \text{R} \end{matrix}$$

**Carbocation ( $\text{C}^+$ )**  
Carbon species carrying +ve charge on carbon having only six electrons in its valence shell.

**Stability**  

- More the number of alkyl/aryl groups present, greater is the stability.
- Electron donating groups increase the stability whereas electron withdrawing groups decrease the stability.
- The decreasing order of the stabilities of carbocations:  $(\text{Ph})_3\text{C}^+ \approx (\text{R})_3\text{C}^+ > \text{CH}=\text{CH}_2 > (\text{Ph})_2\text{CH}^+ > \text{RCH}=\text{CH} > \text{CH}_2 > \text{PhCH}_2^+ > (\text{R})_2\text{CH}^+ > \text{CH}_2 > \text{CH} > \text{CH} > \text{CH}_2 > \text{Ph} \text{ or } \text{Ar}$

**Structure**  

$$\begin{matrix} \text{Empty } p\text{-orbital} \\ | \\ \text{R} & \text{C} & \text{R} \\ / & & \backslash \\ \text{R} & & \text{R} \\ | & & | \\ \text{R} & & \text{R} \end{matrix}$$

**Carbanion ( $\text{C}^-$ )**  
Carbon species carrying -ve charge on carbon having eight electrons in its valence shell.

**Stability**  

- More the number of alkyl groups present, lower is the stability.
- Electron withdrawing groups increase stability whereas electron donating groups decrease stability.
- The order of stability of carbanions:  $(\text{C}_6\text{H}_5)_3\text{C}^- > (\text{C}_6\text{H}_5)_2\text{C}^- > \text{C}_6\text{H}_5\text{CH}_2^- > \text{allyl}^- > \text{CH}_2^- > \text{1}^\circ\text{alkyl}^- > \text{2}^\circ\text{alkyl}^- > \text{3}^\circ\text{alkyl}^-$
- Note: Carbanions are  $sp^3$ -hybridised with pyramidal geometry. Due to steric hindrance of three phenyl (Ph-) groups, and to acquire pyramidal geometry, lots of energy is required due to which  $\text{Ph}_3\text{C}^-$  is less stable than  $\text{Ph}_2\text{CH}^-$ .

**Structure**  

$$\begin{matrix} \text{R} & & \text{R} \\ / & & \backslash \\ \text{C} & & \text{C} \\ | & & | \\ \text{R} & & \text{R} \end{matrix}$$

**Free Radical ( $\text{C}^\cdot$ )**  
Atom or a group of atoms having odd or unpaired electron having seven electrons in its valence shell. They are highly unstable, electrically neutral and short-lived species.

**Structure**  

$$\begin{matrix} \text{R} & & \text{R} \\ / & & \backslash \\ \text{C} & & \text{C} \\ | & & | \\ \text{R} & & \text{R} \end{matrix}$$

**Singlet**  
 $sp^2$  hybridised (bent), diamagnetic.

**Carbene ( $\text{C}^:$ )**  
Neutral, divalent carbon species in which two non-bonding electrons are present along with two bonding pairs (i.e. having sextet of electrons).

**Structure**  

$$\begin{matrix} \text{R} & & \text{R} \\ / & & \backslash \\ \text{C} & & \text{C} \\ | & & | \\ \text{R} & & \text{R} \end{matrix}$$

**Triplet**  
 $sp$  hybridised (linear), paramagnetic.

**Benzynes**  

$$\begin{matrix} \text{sp}^2 \\ | \\ \text{C} \\ | \\ \text{sp}^2 \end{matrix}$$

**Nitrenes or Imidogens ( $\text{R}-\text{N}^:$ )**  
Neutral, univalent nitrogen species in which nitrogen has a sextet of electrons. They are highly reactive and act as strong electrophiles.

**Structure**  

$$\begin{matrix} \text{R} & & \text{R} \\ / & & \backslash \\ \text{N} & & \text{N} \\ | & & | \\ \text{R} & & \text{R} \end{matrix}$$

**Triplet**  
An additional bond is formed between two neighbouring carbon atoms by side ways overlapping of two  $sp^2$ -orbitals. The new bond orbital lies along with side of the ring and has little interaction with the  $\pi$ -electron cloud lying above and below the ring. This sideways overlapping is weak and thus, makes the benzyne more reactive.

**Structure**  

$$\begin{matrix} \text{R} & & \text{R} \\ / & & \backslash \\ \text{C} & & \text{C} \\ | & & | \\ \text{R} & & \text{R} \end{matrix}$$
